NOTES

The Universal Wing Rail System is designed to fit on any aircraft model that has enough wing or fuselage space to attach the rails.

Once slotted in, a pylon mount item is held in place by friction. You might need to “break in” the rails using an empty pylon (Part 04 or 05 in the Underwing Stores PDF) to loosen them up just enough to allow items to slide in and out without excessive force.

When gluing rails into place, take care to ensure that you do not get any glue on the free-sliding section of the rails.

The gray and white pylons and rails are included for the Crotale IIIc and IV models. The tan pylons and rails are intended for the Percheron, Haflinger, or any aircraft in the Colonial tan scheme.

The Super Crotale upgrade parts allow you to upgrade a standard Crotale IIIc to a Super Crotale IIIId, the final III variant to see service before the Crotale IV entered service. Enough parts are included to upgrade three models. These parts are included in both gray and white.
